Constructive Solid Geometry
CSG
(Geometri Padat Konstruktif)

Outline

- Pengertian Constructive Solid Geometry-CSG (Geometri Padat Konstuktif)
- Bentuk standar CSG
- Operasi Boolean untuk CSG
- Ekpresi/pernyataan untuk CSG
- Transformasi skala, translasi dan rotasi untuk CSG

Object Representation

- Real and virtual objects can be represented by :
  - Solid models such as spheres, cylinders and cones
  - Surface models such as triangels, quads and polygons
- Surface models can be rendered either by
  - Object-order rendering
  - Image-order rendering (i.e. ray tracing)
- Solid models can only be rendered by ray tracing
- Solid models are commonly used to describe man-made shapes
  - Computer aided design
  - Computer assisted manufacturing

Constructive Solid Geometry (CSG)

- Constructive solid models can consists of primitive shapes such as
  - Sphere
  - Cylinder
  - Cone
  - Pyramid
  - Cube
  - Box
- Constructive solid models cannot consist of half spaces such as
  - Points
  - Lines
  - Planes

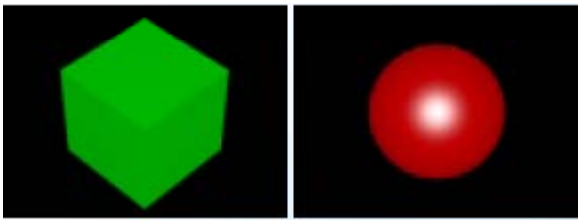
CSG - Boolean Operation

- CSG combines solid objects by using three (four) different boolean operations
    - Intersection (∩)
    - Union (+)
    - Minus (-)
    - (complement)

- In theory the minus operation can be replaced by a complement and intersection operation

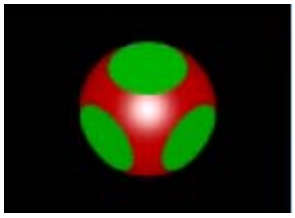
- In practice the minus operation is often more intuitive as it corresponds to removing a solid volume

CSG Combine



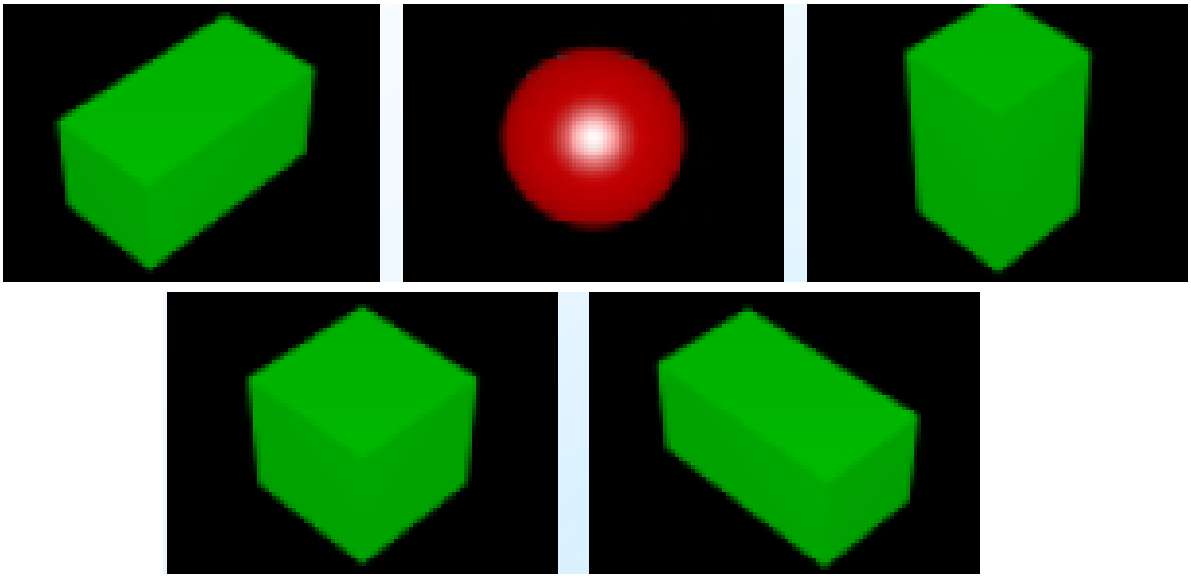
CSG - Union

CSG - Intersection



CSG - Minus

CSG - Tree



CSG - Tree

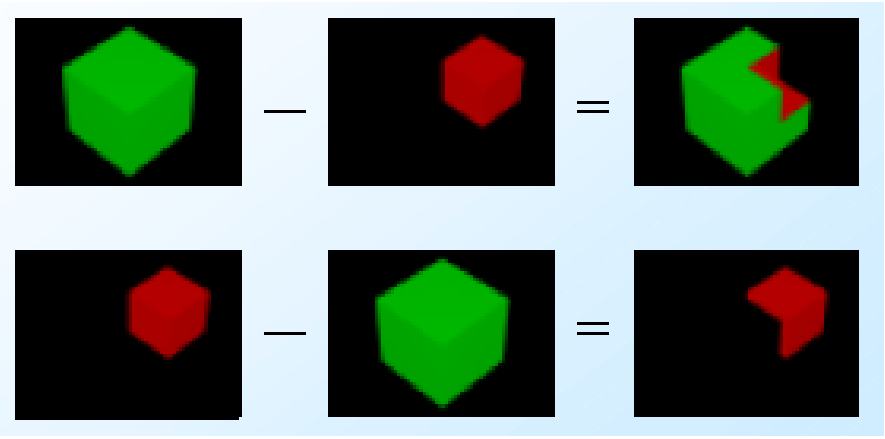
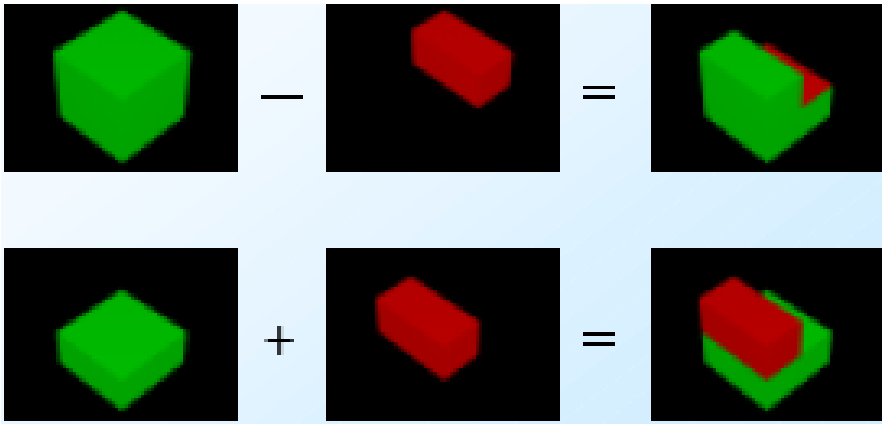
Cube
Box

CSG - Operations

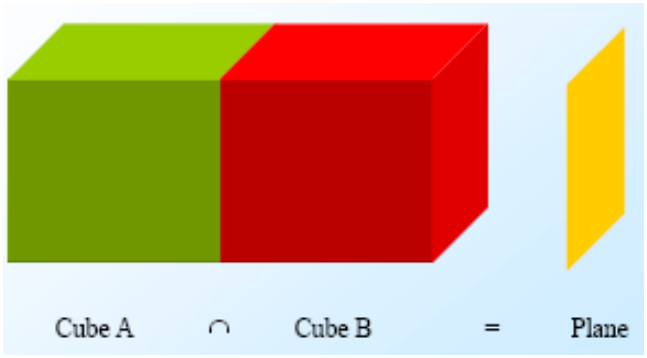
- CSG operations are not commutative

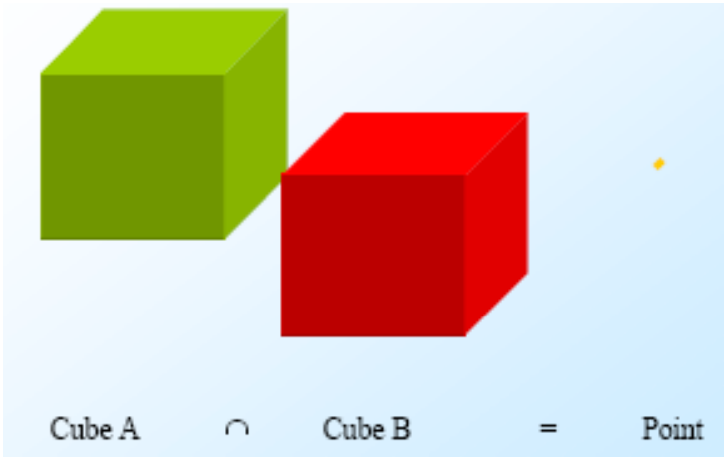


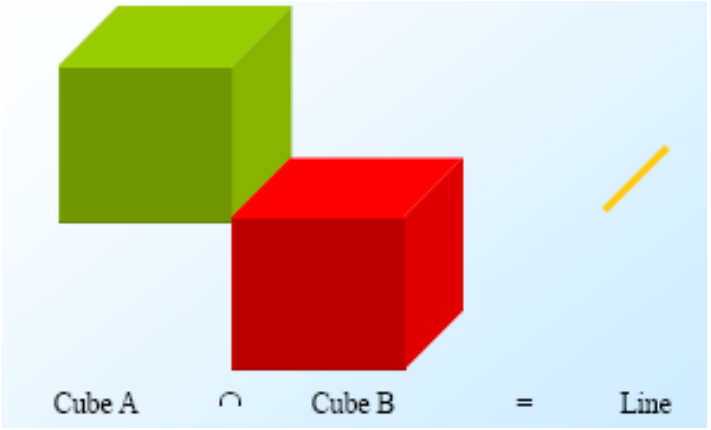
- CSG operations are not unique



CSG Tree Problems







CSG – Interior, Exterior, Closure

- a point **p** is an interior point of a solid **s** if there exists a radius *r* such that the open ball with center **p** and radius *r* is contained in the solid **s**. The set of all interior points of solid **s** is the interior of **s**, written as **int**(**s**). Based on this definition, the interior of an open ball is the open ball itself.

- a point **q** is an exterior point of a solid **s** if there exists a radius *r* such that the open ball with center **q** and radius *r* is not contained in **s**. The set of all exterior points of solid **s** is the exterior of solid **s**, written as **ext**(**s**).

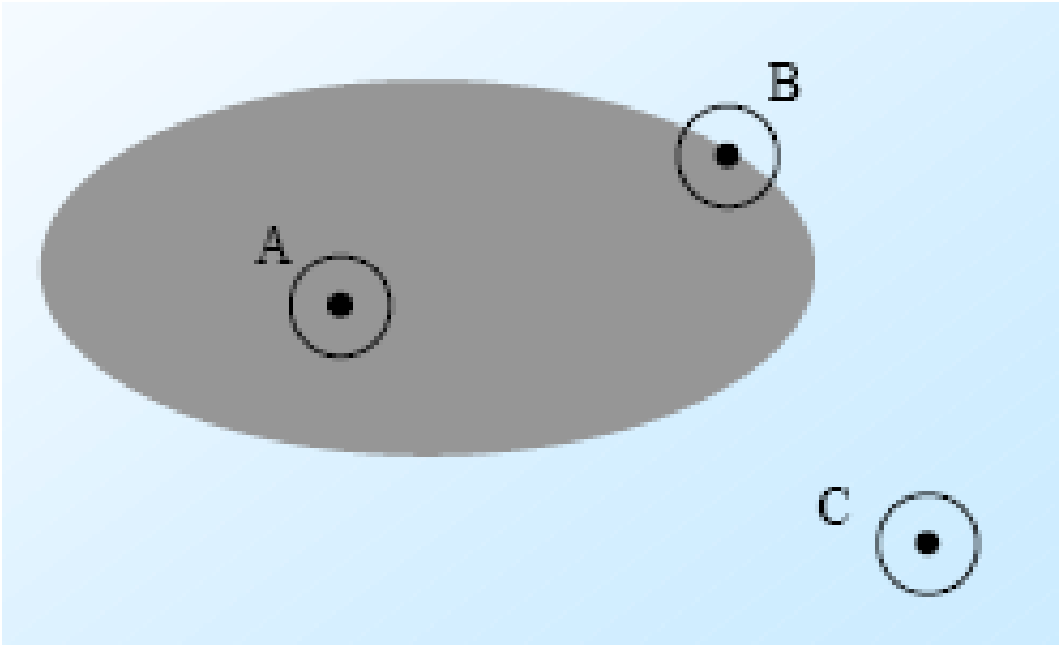
- all points that are not in the interior nor in the exterior of a solid **s** are the boundary of solid **s**. The boundary of **s** is written as **b**(**s**). Therefore, the union of interior, exterior and boundary of a solid is the whole space.

- the closure of a solid s is defined to be the union of **s**'s interior and boundary, written as **closure**(**s**). Or, equivalently, the closure of solid **s** is all points that are not in the exterior of **s**.

CSG – Interior, Exterior, Closure

- Definition of an open ball

$$(x_0 - x)^2 + (y_0 - y)^2 + (z_0 - z)^2 < r^2$$



CSG – Interior, Exterior, Closure

- Consider a sphere:

$$x^2 + y^2 + z^2 = r^2$$

- The interior of a sphere is

$$x^2 + y^2 + z^2 < r^2$$

- The closure of a sphere is

$$x^2 + y^2 + z^2 \leq r^2$$

- The exterior of a sphere is

$$x^2 + y^2 + z^2 > r^2$$

- A solid is a three-dimensional object
  - The interior of a solid is a three-dimensional object
  - The boundary of a solid is a two-dimensional surface

CSG – Interior, Exterior, Closure

- To eliminate these lower dimensional branches, the three set operations are regularized:
  - Compute the result as usual and lower dimensional components may be generated.
  - Compute the interior of the result. This step would remove all lower dimensional components. The result is a solid without its boundary.
  - Compute the closure of the result obtained in the above step. This would add the boundary back.

CSG – Interior, Exterior, Closure

- Let +, ∩ and – be the regularized set union, intersection and difference operators. Let A and B be two solids. Then, A + B, A ∩ B and A – B can bedefined mathematically based on the abovedescription:
  - A + B = **closure**(**int**(the set union of A and B)
  - A ∩ B = **closure**(**int**(the set intersection of A and B)
  - A – B = **closure**(**int**(the set difference of A and B)

Ray Tracing CSG Trees

- CSG trees must be rendered by ray tracing

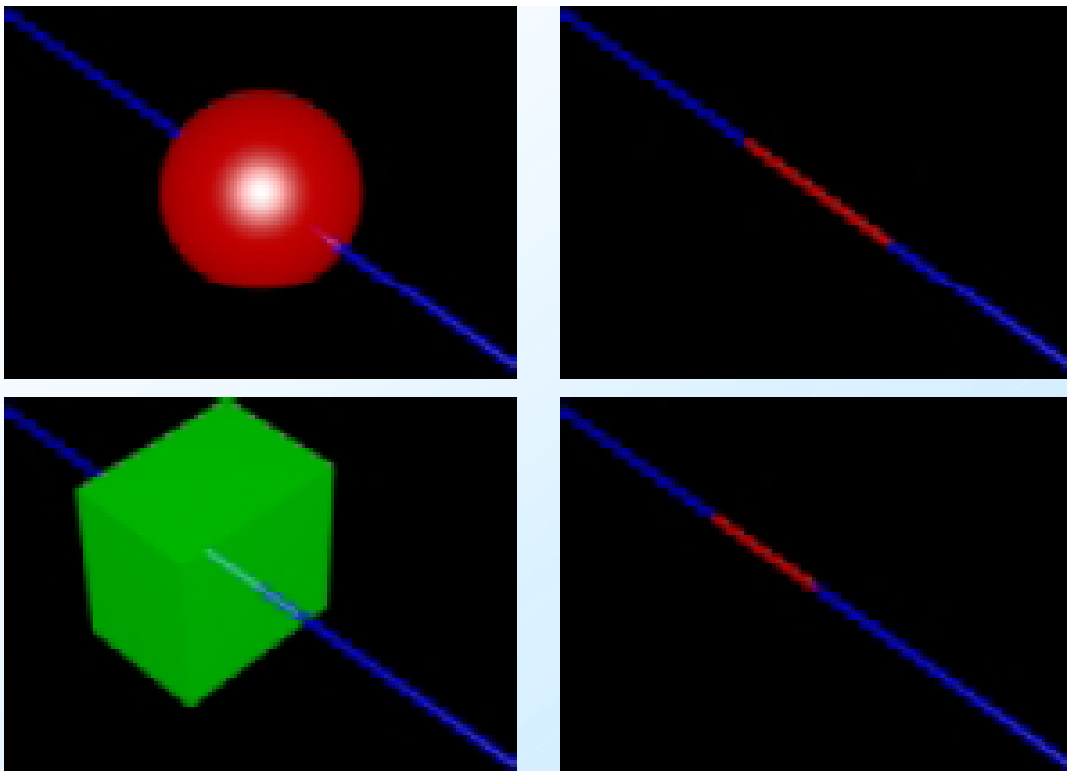
- CSG trees must be traversed in a depth first manner
  - traversal starts at the leaf nodes
  - traversal of each node yields a list of line segments of the ray that pass through the solid object
  - list of lines segments is passed to parent node and processed accordingly

- Each list of line segments (or spans) may be characterized by the alpha values representing the intersection points of the corresponding ray equation:

$$(\mu_1, \mu_2, \ldots, \mu_n)$$

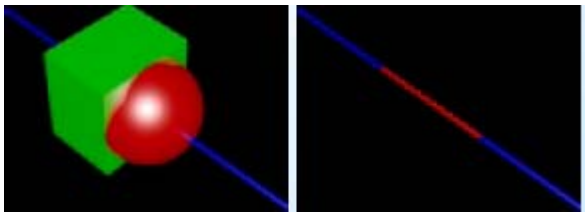
- Each list of line segments will either contain
  - an odd number of intersection points (the viewpoint is inside the solid object)
  - an even number of intersection points (the viewpoint is outside the solid object)
  - an empty list of intersection points

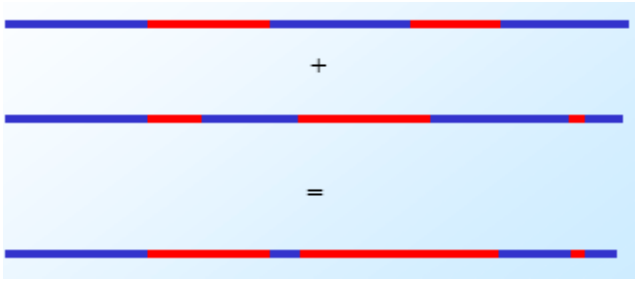
Ray Tracing CSG Trees



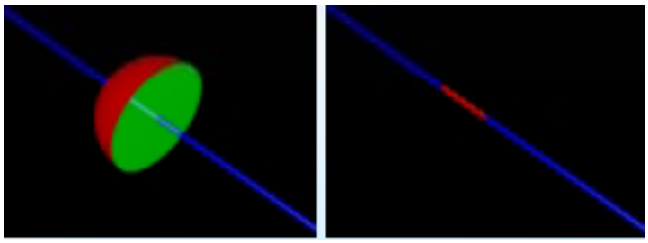
Ray Tracing CSG Trees

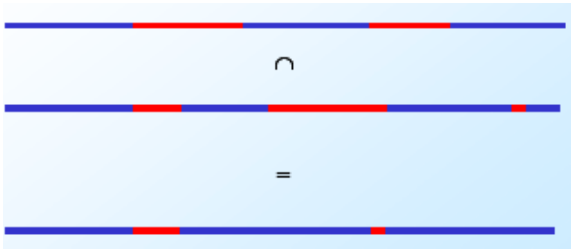
- Ray Tracing CSG Tree : Union



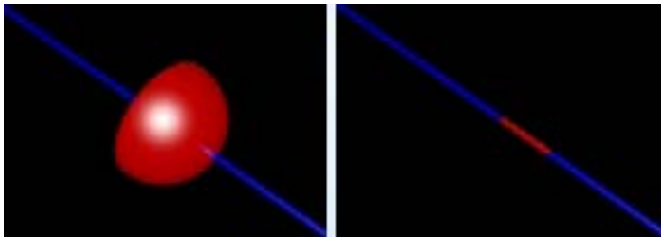


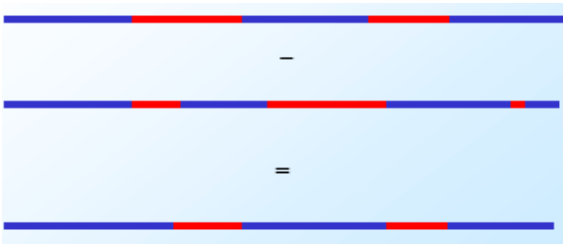
- Ray Tracing CSG Tree : Intersection





- Ray Tracing CSG Tree : Minus





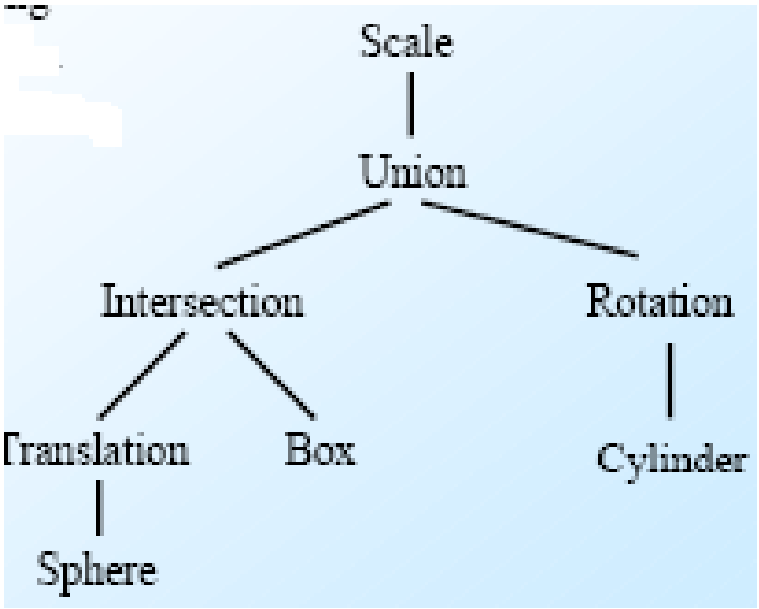
Ray Tracing CSG Trees

- CSG trees can be pruned during ray tracing:
  - if the left or right subtree of an intersection operation returns an empty list, then the other subtreed need not be processed.
  - if the left subtree of a minus operation returns an empty list, then the right subtree need not be processed.

- CSG trees can use bounding boxes/spheres to speed up rendering:
  - each primitive that does not belong the currently processed bounding volume may be represented by an empty intersection list

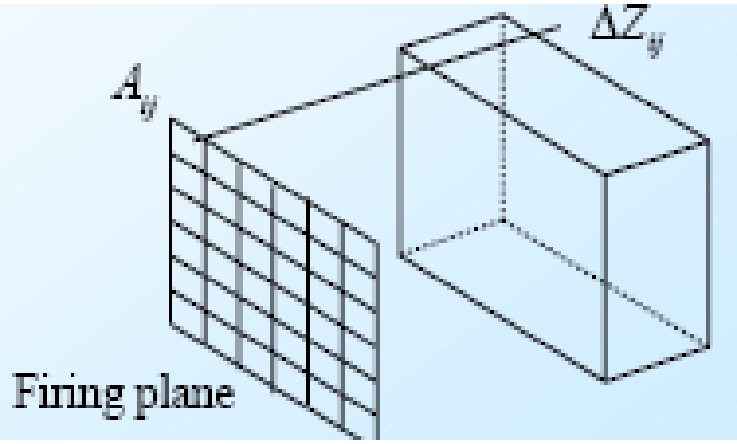
Extending CSG Tree

- Adding transformations as primitive operations:
  - scaling
  - rotation
  - translation



Calculating properties of CSG Trees

- Ray tracing can be used to approximate the physical properties of objects including
  - volume
  - mass
- by firing a set of parallel rays from a firing plane



Calculating properties of CSG Trees

- Volume:

$$V \approx \sum V_{ij}$$

where

$$V_{ij} = A_{ij} \Delta Z_{ij}$$

- A_{ij} is the area in the firing plane
- ΔZ_{ij} is the distance between two intersection points along the firing ray

- Mass:

$$M \approx \sum M_{ij}$$

$$M_{ij} = A_{ij} \Delta Z_{ij} \rho_{ij}$$
